

Types of data in GIS - basic division

Types of data in GIS: raster and vector data

▶ Raster data

1	1	3	6
1	1	3	6
1	3	6	6
3	6	6	6
3	6	6	6
3	6	6	6

▶ Vector data

Types of data in GIS: raster and vector data

▶ Raster data

1	1	3	6
1	1	3	6
1	3	6	6
3	6	6	6
3	6	6	6
3	6	6	6

- ▶ area divided into finite areas = cells/pixels that completely cover it
- ▶ see below for cell shape
- ▶ each cell holds one value in one layer
- ▶ this value is displayed in one color when displaying the visualization - see fig.
- ▶ the value represents the property of the given cell (surface type, temperature, slope, ...)
- ▶ they mostly "deform" the shape of the displayed object

Types of data in GIS: raster and vector data

Vector data

a broken line, not a curve

- ▶ of different geometric types – point, line, area (in 2-dimensional space)
- ▶ they do not have to cover the entire area of the space
- ▶ a greater amount of information can be attached to individual objects - see the next part of the lectures
- ▶ they mostly model the shape of objects "more accurately".

Geographic information, data

Geographic information

6

The geographic information is:

- ◉ geometric,
- ◉ topological ,
- ◉ thematic
- ◉ dynamic description object

Which is in

- numerical form
- text form
- in the form of image data
- multimedia form

Geographic information

7

Geodata are formal transcriptions of geographic information into a form suitable for computer processing

Geodata therefore identify:

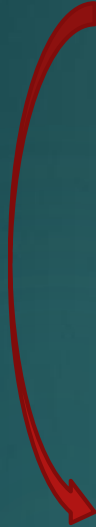

- ▶ **geographic location** and
- ▶ **characteristics** natural and anthropogenic phenomena and the boundaries between them.

Geographic information

8

Spatial objects - have:

- ▶ geographic location
- ▶ spatial relationships
- ▶ Its attribute properties
- ▶ Its development over time - displayed by a dynamic description

Levels of abstraction reality determines how these objects are stored in the GIS

Geographic information

What is the content of GIS?

- ▶ **element/object, phenomenon, both = entity** - a formation no **longer divisible** , clearly distinguishable from other elements - object, phenomenon as

FSV CTU,

flood 12.8. 2004,

accident near Prachatice 1/1/1995

- ▶ **feature class** - a complete **system of features** with common properties - mostly displayed in the same way graphically

▶

colleges ,

floods,

traffic accidents

Geographic information

- ⦿ **Entity** = element/object, phenomenon - its unambiguous determination given
 - ⦿ by inclusion in a class of elements in a unique database and
 - ⦿ definite inclusion in this class
- ⦿ **feature class** - unambiguous determination given by a unique designation (attribute) in one database
 - feature class = family house - all family houses tend to have the same list of attributes, but may not have the same graphic attributes:
 - **class attributes** – descriptive data in the database
 - **graphic attributes** – display method on the monitor or for printing

Object-based (= vector GIS) vs. raster GIS

11

The lectures are further divided by type

- ▶ vector GIS
- ▶ raster GIS
